MAYO CLINIC LABORATORIES

Test Definition: CBC

Complete Blood Cell Count (CBC) with Differential, Blood

Overview

Useful For

Screening tool to confirm a hematologic disorder, to establish or rule out a diagnosis, to detect an unsuspected hematologic disorder, or to monitor effects of radiation or chemotherapy

Reflex Tests

Test Id	Reporting Name	Available Separately	Always Performed
DIFFR	Morphology Eval (special Smear)	No	No
PINTP	Peripheral Smear Interpretation	No	No

Testing Algorithm

A morphology evaluation is performed at an additional charge when the automated 5-part differential is invalid or when abnormal results are identified upon microscopic examination.

A peripheral blood smear review is performed at an additional charge when pathologist expertise is needed for clinically significant diagnosis.

Method Name

RF/DC (Radio Frequency/Direct Current) Detection/Hydrodynamic Focusing (DC Detection), Flow Cytometry (Using a Semiconductor Laser)/Sodium Lauryl Sulfate (SLS) Hemoglobin

NY State Available

Yes

Specimen

Specimen Type

Whole Blood EDTA

Specimen Required

Container/Tube: Lavender top (EDTA)

Specimen Volume: 3 mL

Forms

If not ordering electronically, complete, print, and send a Kidney Transplant Test Request with the specimen.

Specimen Minimum Volume

1.5 mL

Reject Due To

Gross hemolysis	Reject
Other	Clotted

Specimen Stability Information

Specimen Type	Temperature	Time	Special Container
Whole Blood EDTA	Refrigerated (preferred)	48 hours	
	Ambient	24 hours	

Clinical & Interpretive

Clinical Information

RBCs, WBCs, and platelets are produced in the bone marrow and released into the peripheral blood. The primary function of the RBC is to deliver oxygen to tissues. WBCs are key components of the immune system. Platelets play a vital role in blood clotting.

Mean corpuscular volume (MCV) is a measure of the size of the average RBC. Anemias are characterized as microcytic (MCV <80), macrocytic (MCV >100), or normocytic. The red cell distribution width (RDW) is a measure of the degree of variation in RBC size (anisocytosis). RDW may be helpful in distinguishing between some anemias. For example, iron deficiency anemia is characterized by a high RDW, while thalassemia is characterized by a low RDW.

These counts are used as clinical guides in the diagnosis or monitoring of many diseases.

Interpretation

Results outside of normal value ranges may reflect a primary disorder of the cell-producing organs or an underlying disease. Results should be interpreted in conjunction with the patient's clinical picture and appropriate additional testing performed.

Cautions

Questionable results are detected by in-house checking criteria based on quantitative and qualitative parameters.

Defined laboratory instrument or patient flagging criteria may trigger peripheral blood smear review resulting in consultant readout of hematologic abnormalities.

Performance

Method Description

The Sysmex XN 9000 performs hematology analysis according to the hydrodynamic focusing (DC detection), flow cytometry method (semiconductor laser), and sodium lauryl sulfate (SLS)-hemoglobin method.(Instruction manual: Automated Hematology Analyzer XN series [XN-9000], Code No. CJ410539. North American Edition. November 2015)
